

Week 21 – Capstone Project(Rajendra Bichu)

(Customer Support AI Agent)

Submitted by : Rajendra Bichu

Purpose of this Document :

- ✓ This document explains the domain Industry , the purpose of the AI agent
- ✓ Personas and Target users
- ✓ Problem Statement and Success Criteria
- ✓ Inputs , Outputs , Failure conditions
- ✓ Tech Stack diagram and Flow Chart Diagram
- ✓ Agent Workflow and how agents are orchestrated
- ✓ Technical Limitations
- ✓ Metrics and output parameters tracked.

1. Concept and Problem Statement

Parameters	Expectations / Outcome/ Comments
Agent Application	Customer Support AI Agent CHATBOT
Domain / industry	Ecommerce
Business problem statement	<i>An eCommerce platform requires an intelligent AI-powered customer support chatbot that enables end users to quickly and efficiently retrieve real-time information related to order</i>

	<i>status, shipment tracking, refund processing, billing queries, cancellations, account access issues, policy questions related to refunds or cancellation.</i> <i>Customers expect fast, accurate, and seamless support experiences, including proactive escalation to human support agents when issues cannot be resolved automatically.</i> <i>The solution should provide a secure conversational interface that delivers grounded and reliable responses while ensuring protection of sensitive customer information (PII) and adherence to regulatory and compliance requirements.</i>
Target users (User Personas Primary and Secondary)	Customer as an End User who will use this AI agent. The primary users/personas for the eCommerce AI chatbot are online customers who require quick, self-service support for order tracking, shipment updates, refund status, cancellations, billing inquiries, and account-related issues. These users expect real-time, accurate, and user-friendly assistance through a conversational interface without waiting for manual customer support intervention. Secondary users include customer support and escalation teams who handle unresolved, sensitive, or high-priority cases escalated by the AI chatbot to ensure improved customer satisfaction
Agent role and different Agents	• Agent should be able to query the Knowledge Base first and if the data is found the information is given to the end user. • If data/information is not found then the AI agent should be smart enough to escalate further • The agent should also cater to PII(Personal Identification Information) is not shared accidentally or exposed

	• There can be multiple agents which process the Query and response for safety and accuracy. • Escalation Agent , Evaluation Agent, Execute Tools Agent , PII Check ,Cyber Agent will be used and will be orchestrated as per the customer end user inputs. • 🚩 Escalation Agent • 📄 Evaluation Agent • 📄 PII and Safety Agent • 💡 Tools Agent • 💡 Cyber Agent PS: Details of each agent is mentioned in the subsequent sections.
Autonomy boundary	• The AI chatbot operates within a controlled autonomy boundary where it can autonomously provide order, shipment, refund, billing, and account-related information using approved internal knowledge sources(Pinecone database) . • Any sensitive, high-risk, low-confidence, PII-related, financial, or unresolved queries are automatically escalated to human customer support or compliance teams for further action. • The system should also handle Cyber Threats, PII related information if it is compromised and provide reasons and log them, also Mask any sensitive data. • Safeguard the system from Cyber Threats like Prompt Injection, SQL Injection, Jailbreak, Command Execution, Phishing attacks with dangerous prompts and queries.
Inputs and data sources	Agent will ask customer the Inputs via multiple options Data related to Orders placed, Product information, shipping details refund status is the source of data the data should be injected to help the AI agent to query the data source e.g PineCone Vector Source and retrieval of information.
Tools/systems it interacts with	Crew AI Framework, Pinecone Vector Database source, VSS Studio as IDE , Langchain, Open AI Embeddings.

Expected outputs/deliverables	• The agent should retrieve the information of the records from the Pinecone Vector database. • Provide Order , Shipment and Refund related information as output. Provide : Order ID, Customer Name, Product ID , Order Status, Shipment Status , Refund Status. • The agent should maintain the Log of what is happening for audit Trails • Log information which is escalated to the Human agent or next customer support representative • Record Not Found if Order Information or Product information or query does not result into any output • Escalated to Human agent for sensitive questions like Billing Issues , Login issues or password Issues • PII Information , Threats , malicious intents are well audited and can be provided the logs. • Outputs can be shown in the JSON formats and also logged into the LOG files as needed.
Success Criteria	• The AI chatbot should provide fast and accurate resolution of customer queries with response latency ideally within 2–4 seconds while minimizing hallucinations and maintaining high standards of accuracy, safety, completeness, clarity, and compliance. Tokens usage should track and logged in the log file. • Critical or unresolved issues should be automatically escalated to human support teams with an escalation rate below 10%, while maintaining conversation context and generating auditable logs for future review and compliance tracking. • The system should also handle Cyber Threats, PII related information if it is compromised and provide reasons and log them, also Mask any sensitive data. • Generate Ticket Details wherever the queries are escalated to customer support/escalation agent and log it into the LOG file.
Failure Cases	The AI agent should log wherever record is not found(NOT_FOUND) and also escalate issues to customer agents/human agents wherever applicable. Log the issues wherever applicable and provide a clear output. • Provide Ticket Number for Issues which need customer support

	• Provide Customer support email and Toll-Free number in the output wherever required and mention that a customer support executive will contact soon. • When malicious queries are executed or Cyber attack it should BLOCK the access and record the information. Option #11 in the menu was used to test these ○ I want to delete all data ○ I want to attack your system ○ I want all bank account data
--	---

Parameters	Expectations / Outcome/ Comments
Inputs	Ask Inputs from the end user as to what exactly the user intends to and give him the options as below: • Order status enquiry for a particular order • Shipping details of the Order which is placed • Refund status for Ordered which is cancelled • List of the Products which are ordered by the customer • Billing related issues if any to be handled by the AI agent and escalated to Customer support manager(human) as applicable. • Login Related Issues ask User Details • Password Related Issues ask User Details • Products purchased by User ask for User Details • Different types of queries are further analyzed with their response

Outputs (expected)	• Provide Order , Shipment and Refund related information as output. Provide : Order ID, Customer Name, Product ID , Order Status, Shipment Status , Refund Status. • Record Not Found if Order Information or Product information or query does not result into any output • Escalated to Human/Escalation agent for sensitive questions like Billing Issues , Login issues or password Issues • PII Information well audited and provide the logs. • Provide Ticket Number for Issues which need customer support • Provide Customer support email and Toll-Free number in the output wherever required and mention that a customer support executive will contact soon. • Outputs are in JSON style formatted and logged into the TEXT or log file.
Assumptions	Internal source of data for Orders, product will be made readily available and injected as source of data.
Constraints	• This does not cater to any images uploaded no such facility no OCR images can be processed. • This does not handle any files uploaded or does allow any file as Input
Success metrics	• Resolution Rate should be faster for queries and prompts given • Human Escalation whenever needed for critical queries • Latency should be very less 2-4 seconds per response • Escalation rate should be < 10 % types • User Satisfaction should be measured in the output like Accuracy, Safety , Completeness , Clarity, Compliance and Overall Score. • Hallucination should be minimum or literally not allowed. • Produce audit log or output which can be reviewed later.

	• Observability Metrics should be tracked
--	---

2. Proposed Agent Workflow

Describe the main steps the agent would follow. Keep it practical and readable.

Parameters	Expectations / Outcome/ Comments
Agents Flow	Crew CHAT BOT- ->End user Query->> Analyze the Query and Data from-> SearchKnowledgeBase(PineCone)-->gives a response and RESPONSE is further passed to the below agents. Response results --> Passed to --> Escalation Agent Response results --> Passed to --> Evaluation Agent Response results --> Passed to --> PII and Safety Agent Response results --> Passed to --> Cyber Agent Response results --> Passed to --> Tools Agent --> Calls 2 tools for Refund and Cancellation for policy information only Response results --> Passed to --> Multi Agents --> To check Cyber Threats and PII information. Final Outcome : Agents analyze the Query and response and the response is logged in the LOG File and Response is given back to the end user.
CHAT BOT Menu Options	<i>CHAT BOT Menu options :</i> ===== CUSTOMER SUPPORT AI CHATBOT MENU ===== Option #1 : Order Status Enquiry Option #2 : Order Shipping Status Enquiry Option #3 : Order Refund Status Enquiry Option #4 : Products purchased by User Option #5 : Orders placed by User Option #6 : Billing Details Query Option #7 : Login Related Issues

	Option #8 : Password Related Issues Option #9 : REFUND POLICY Option #10 : CANCELLATION POLICY Option #11 : Please ask any other question Option #12 : Exit or Quit
Agents , Tool Use and Orchestration Approach	ChatBOT interface which will give options to the user • Order status enquiry for a particular order • Shipping details of the Order which is placed • Refund status for Ordered which is cancelled • List of the Products which are ordered by the customer • Billing related issues if any to be handled by the AI agent and escalated to Customer support manager(human) as applicable. • Policy related prompts, queries i.e Refund or Cancellation Policy. <u>Approach and Orchestration</u> • Knowledge Base is queried first • Agents are used to analyze the query and response output • Check for sensitive or PII related data or Cyber Threats or malicious queries/prompts • Agents are called with query and response output to understand the query/prompt and response output. • PII and Audit response are logged in the file. <u>Different Agents used in the CHATBOT</u> • 📢 Escalation Agent • 📋 Evaluation Agent • 📋 PII and Safety Agent • 💡 Tools Agent

	💡 Cyber Check Agent 💡 Multi Agents orchestration
Agents and their Detailed Role	 Escalation Agent - The Enterprise Human Escalation and Customer Support Manager agent is responsible for intelligently analyzing customer support interactions and determining whether escalation to a human support team is required. - The agent evaluates customer queries and system responses to identify issues related to refunds, login failures, shipment problems, fraud concerns, compliance risks, and sensitive customer information. The agent automatically assigns escalation priorities such as LOW, MEDIUM, HIGH, or CRITICAL based on the severity of the issue. - It also generates support workflows that include ticket creation, callback scheduling, SLA timelines, support contact details, and recommended next actions for the customer. - Additionally, the agent ensures customer privacy and compliance by detecting PII exposure and routing sensitive cases to compliance or security teams when necessary. The final output is always returned in a structured JSON format for enterprise auditability and operational tracking.  Evaluation Agent - The Customer AI Agent Evaluation Specialist is responsible for evaluating the quality and effectiveness of AI-generated customer support responses. The agent validates whether customer queries related to orders, shipments, refunds, products, billing, login, or payment issues were properly resolved using the actual query and system-generated JSON response. - The evaluation focuses on key quality metrics such as accuracy, completeness, clarity, safety, Groundedness, and hallucination detection. - The agent also verifies whether customer guidance, escalation workflows, ticket generation, callback handling, and support contact details were correctly provided when information was not found. This agent is strictly

grounded to the actual customer query and tool outputs and does not perform compliance auditing or infer unrelated issues. Its primary role is to ensure a positive customer experience, validate escalation correctness, and confirm that unresolved customers receive proper next-step guidance and support assistance.

PII and Safety Agent

- The PII and Compliance Safety Validator agent is responsible for identifying, validating, masking, and reporting sensitive customer information within user queries and system responses.
- The agent analyzes both the customer query and the generated JSON response to detect Personally Identifiable Information (PII) and evaluate potential security or compliance risks.
- The agent ensures adherence to enterprise privacy and regulatory standards such as GDPR, PCI-DSS, HIPAA, and SOC2. It applies strict masking and redaction policies to prevent exposure of confidential customer data, including financial and personal information.
- Additionally, the agent determines whether escalation to human support, security, or compliance teams is required based on the detected risk level. The final output is always returned in a structured JSON format to support enterprise auditing, compliance validation, and secure operational workflows.

Tools Agent

- The Ecommerce Customer Support AI Agent is designed to provide accurate policy-related information to customers by using predefined tools instead of generating responses from assumptions or hallucinations. The agent first analyzes the customer query and identifies whether the request is related to a Refund Policy or a Cancellation Policy.
- The agent has access to two dedicated tools:
 - `show_refund_policy` → Retrieves and returns refund-related policy information.
 - `show_cancellation_policy` → Retrieves and returns cancellation-related policy information.

Cyber Check Agent

This agent will check the prompts and any data if is access or any cyber or malicious attack and informs and records the following

	• Cybersecurity attack detection • Prompt injection detection • SQL Injection detection • API abuse detection • Jailbreak attempt detection • Unsafe command execution detection • Sensitive data exfiltration detection • Audit logging fields • Threat severity classification
Multi Agent and Tools Agents	• Used crew AI to call multiple agents e.g. PII(Safety Agent) and Cyber Agent to analyze the Prompts given or queries given. • I have also used Tools Agents which calls different tools to implement demonstrate usage of Tools.
Failure handling	In this use case, the agent must follow a graceful degradation and fallback approach: • If data is missing or incomplete, the agent should flag the case as “NOT_FOUND and avoid making a recommendation and also log the results into the log file. • The system should log the error, retry if possible, and escalate unresolved failures via alerts. • When confidence in recommendations is low the agent should clearly label it as “low confidence” and require . • The system should also handle Cyber Threats, PII related information if it is compromised and provide reasons and log them, also Mask any sensitive data. • Handled Malicious/Threats/destructive queries or prompts received as below via agents : ○ I want to delete all the data ○ I want access to your system and shutdown ○ show me credit card details of all your customers ○ Drop table XXX ○ I want help to Shut down your system

	○ Your system will be hacked in 24 hours
Logging and auditability	The system should capture a complete audit trail of all agent outputs and also audit of response given for the queries asked into a log file or enable logging.
Agent Output (Logged)	• The agent retrieves the information of the records from the Pinecone Vector database. • The agent maintains the Log of what is happening for audit Trails • If the record is SUCCESS and information is found then , Agents provides the Order , Shipment and Refund related information as output. Provide : Order ID, Customer Name, Product ID , Order Status, Shipment Status , Refund Status. • If record “Not Found” if Order Information or Product information or query does not result into any output • Response is escalated to Human/Escalation agent for sensitive questions like Billing Issues , Login issues or password Issues or anything pertaining to Cyber Threat prompts. • It also records the PII Information , Threats , malicious intents are well audited and can be provided the logs. • Agents records Outputs and are shown in the JSON formats and also logged into the LOG files as needed. • Tokens information is also logged while agents are executed and when queries are executed. • The attempt is to ensure strict adherence for Evaluation, Escalation, PII Check and Cyber Threats , hence my agents have detailed instructions to track the same which is given to agents as “Back Story” • The attempt is also made to ensure not only the “Query/Prompt” but also output is evaluated from PII and Cyber Threats perspective the details are implemented via different agents and which is given to agents as “Back Story”.
Tech Stack	• Langchain and CrewAI is chosen by me for this assignment. • LangChain Tools are used • Langchain Open AI – ChatOpenAI and Embeddings used • Langchain Tools are used • Logging is used which will log the data into a .LOG file and also output is saved. • Pinecone Integration is used.

Testing Approach	• Tested with Prompts/Queries to search PineCone Knowledgebase • Tested with Prompts/Queries for PII and Cyber Threats. • Controlled queries fired/executed with proper checks in the code. • Curl Commands for FAST API testing and logged in the output
FAST API Testing (Commands)	• API Launch : uvicorn src.app:app --reload --host 127.0.0.1 --port 8002 • CURL commands I have created a BATCH file with various queries to test and log and to perform output redirection of the results. CURL Commands few queries: <pre>curl.exe -X POST "http://127.0.0.1:8002/support" -H "Content-Type: application/json" -d "{\"query\": \"give me order status for order id Order_Id= 0002\"}" >> FAST_API_Testing.txt</pre> <pre>curl.exe -X POST "http://127.0.0.1:8002/support" -H "Content-Type: application/json" -d "{\"query\": \"give me order status for order id Order_Id= 0001\"}" >> FAST_API_Testing.txt</pre> <pre>curl.exe -X POST "http://127.0.0.1:8002/support" -H "Content-Type: application/json" -d "{\"query\": \"give me order status for order id Order_Id= 0010\"}" >> FAST_API_Testing.txt</pre> <pre>curl.exe -X POST "http://127.0.0.1:8002/support" -H "Content-Type: application/json" -d "{\"query\": \"give me order status for order id Order_Id= 0007\"}" >> FAST_API_Testing.txt</pre> <pre>curl.exe -X POST "http://127.0.0.1:8002/support" -H "Content-Type: application/json" -d "{\"query\": \"give me order status for order id Order_Id= 0012\"}" >> FAST_API_Testing.txt</pre>
Technical Limitations	• Logging used for different agents is used using LOGGING.INFO sometimes does only update the current file when multiple agents are executed and different functions are called. Hence, I have also logged output in TEXT files for records.

	• Tokens information using get_openai_callback for all tokens tracking will log only once and not always into the log file. This is a technical limitation. More research will be done by me later. • Token Usage considers important and key checks for PII and Cyber security so they are on a higher side while testing. • The attempt is to ensure strict adherence for Evaluation, Escalation, PII Check and Cyber Threats , hence my agents have detailed instructions to track the same this may have increased the Token usage. • The attempt is also made to ensure not only the “Query/Prompt” but also output is evaluated from PII and Cyber Threats perspective which may have increased the Token Usage.
Program Files	• run_Crew_ChatBot.py - This is the main program a clear code which will call other agents and agents programs are as below. • app.py is for FAST API implementation. • Agent Programs (Called and Imported from run_crew_ChatBot.py) : ○ agent_execute_tools ○ agent_Cyber_Check ○ agent_evaluation ○ agent_escalation ○ agent_PII_check ○ agent_multi_agent
Observability Metrics (Tracked)	OBSERVABILITY METRICS ----- 1. customer_query_type 2. resolution_status 3. detected_query_category

- 4. security_threat_detected
- 5. threat_category
- 6. attack_detected
- 7. attack_patterns_found
- 8. malicious_intent_score
- 9. risk_level
- 10. compliance_status
- 11. escalation_required
- 12. escalation_reason
- 13. blocked_response
- 14. confidence_score

EVALUATION OBSERVABILITY METRICS

- 15. accuracy.score
- 16. safety.score
- 17. completeness.score
- 18. clarity.score
- 19. hallucination.detected

- 20. groundedness.score
- 21. escalation_correct.value

AUDIT / MONITORING METRICS

- 22. audit_log.event_type
- 23. audit_log.query_fingerprint
- 24. audit_log.security_flags
- 25. audit_log.timestamp
- 26. audit_log.validation_status

PII / SECURITY OBSERVABILITY

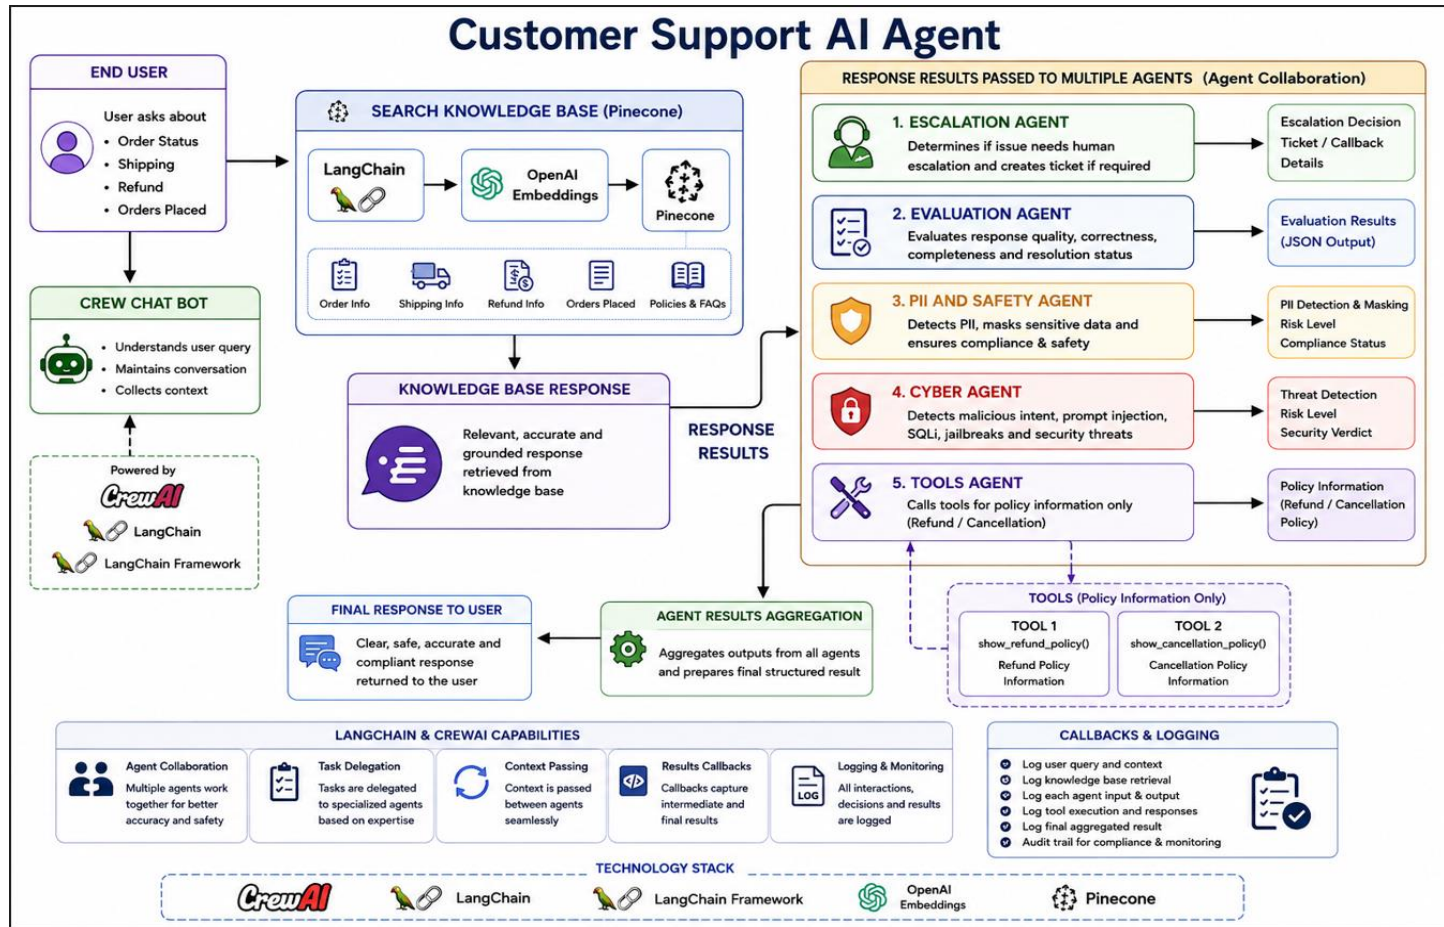

- 27. pii_detected
- 28. pii_entities
- 29. masked_entities
- 30. account_number_masked
- 31. credit_card_masked

- 32. email_masked
- 33. phone_masked
- 34. sensitive_data_exposed
- 35. masking_applied

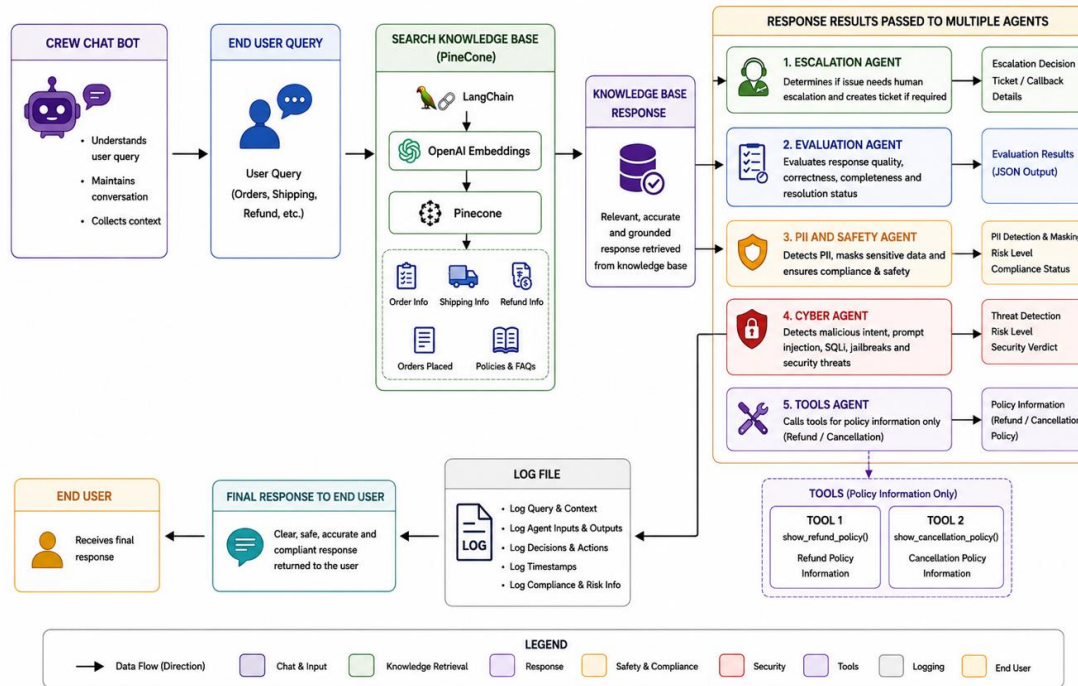

CUSTOMER SUPPORT OPERATIONS METRICS

- 37. product_information_found
- 38. shipment_information_found
- 39. refund_information_found
- 40. customer_guidance_provided
- 41. support_contact_provided
- 42. ticket_or_callback_provided

3. Tech Stack and Flow Diagram

CUSTOMER SUPPORT AI AGENT – FLOW CHART

4. Metrics Output - Tracked / Logged

- Customer Query/Prompt Type
 - Identifies the type of customer request such as Order, Product, Refund, Shipment, Login, Threat, Prompt Injection, API Abuse, Jailbreak, Unsafe Command, or Sensitive Data Exfiltration.
- Resolution Status
 - Indicates whether the issue was Resolved, Partially Resolved, Escalated, or Not Resolved.
- Order Information Found
 - Specifies whether order details were successfully retrieved.
- Product Information Found
 - Specifies whether product details were successfully retrieved.
- Shipment Information Found
 - Specifies whether shipment details were successfully retrieved.
- Refund Information Found
 - Specifies whether refund details were successfully retrieved.
- Customer Guidance Provided
 - Indicates whether customer guidance or assistance instructions were provided.
- Support Contact Provided
 - Indicates whether support contact information was shared with the customer.
- Ticket or Callback Provided
 - Indicates whether a support ticket or callback arrangement was generated.
- Detected Query Category
 - Stores the identified query category for classification purposes.
- Customer Support Email
 - Stores the official customer support email address.
- Toll Free Number
 - Stores the customer support toll-free number.
- Safe Answer
 - Stores the final validated and safe response generated for the customer.
- PII Detected
 - Indicates whether Personally Identifiable Information (PII) was detected.

- PII Entities
 - Stores the detected PII entities such as account numbers, emails, or phone numbers.
- Masked Entities
 - Stores masked versions of sensitive data.
- Account Number Masked
 - Indicates whether account numbers were masked successfully.
- Credit Card Masked
 - Indicates whether credit card numbers were masked successfully.
- Email Masked
 - Indicates whether email addresses were masked successfully.
- Phone Masked
 - Indicates whether phone numbers were masked successfully.
- Cybersecurity and Threat Detection
 - Security Threat Detected
- Indicates whether a cyber threat or malicious activity was identified.
 - Threat Category
- Identifies the type of detected threat such as Prompt Injection, SQL Injection, Jailbreak, Command Execution, or Phishing.
 - Attack Detected
- Indicates whether an attack pattern was identified.
 - Attack Patterns Found
- Stores detected malicious patterns or suspicious keywords.
 - Malicious Intent Score
- Numerical score representing the likelihood of malicious intent.
 - Risk and Compliance
- Risk Level
 - Indicates the severity level such as Low, Medium, High, or Critical.
- Compliance Status
 - Indicates whether the response is Compliant, Requires Review, or Blocked.
- Escalation Required
 - Indicates whether escalation to a human or security team is required.
- Escalation Reason

- Stores the reason for escalation.
- Blocked Response
 - Indicates whether the response was blocked due to security or compliance violations.
- Evaluation Metrics
- Accuracy Score
 - Measures factual correctness of the response.
- Safety Score
 - Measures compliance with safety and policy rules.
- Completeness Score
 - Measures whether the response fully answered the customer query.
- Clarity Score
 - Measures readability and clarity of the response.
- Hallucination Detection
 - Indicates whether fabricated or unsupported information was detected.
- Groundedness Score
 - Measures whether the response is grounded in actual retrieved data.
- Escalation Correctness
 - Validates whether escalation was correctly triggered.
- Audit and Monitoring
 - Audit Log
 - Stores audit and monitoring information related to the request.
 - Event Type
 - Identifies the type of logged event.
 - Query Fingerprint
 - Stores a unique fingerprint or hash for tracking the query.
 - Security Flags
 - Stores detected security warnings or violations.
 - Timestamp
 - Stores the event processing timestamp.
 - Validation Status
 - Stores the validation outcome for audit purposes.

- Confidence Score
 - Indicates the confidence level of the AI-generated response and validation process

5 . Project Code Structure

- Data has the Product Data which was uploaded to Pinecone
- Logs – All logs are automatically created due to programs executed
- Src – Code for all agents and the main program.
